System overview

FPGA:

- Field-programmable gate array
- · reconfigurable logic gates
- · experiment control and communication

Spikey:

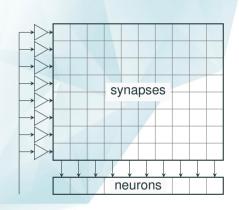

- 384 neurons, 384 × 256 synapses
- speedup of 10⁴

The analog core

Synapses:

- 4 bit weights (0...15)
- STDP and STP

Neurons:

- Leaky-integrate-and-fire model (LIF)
- analog parameters can be configured freely

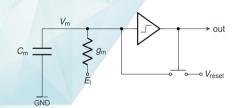

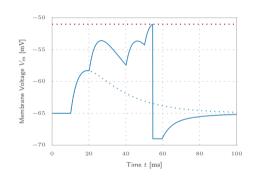

Leaky-integrate-and-fire neurons

$$C_{\rm m} \frac{\mathrm{d} V_{\rm m}}{\mathrm{d} t} = -g_{\rm I}(V_{\rm m} - E_{\rm I}) + I_{\rm syn} + I_{\rm ext}$$

Working with Spikey

PyNN API documentation

https://neuralensemble.org/docs/PyNN/0.7/api/api-0.7.html

Look out for:

- pynn.Population
- pynn.Projection
- pynn.*Connector

Creating (groups of) neurons

Create populations of neurons:

```
params = {
    "v_thresh": -60.0
    }
neurons = pynn.Population(42, pynn.IF_facets_hardware1, cellparams=params)
```

Get a list of default neuron parameters:

print pynn.IF_facets_hardware1.default_parameters

Generating stimuli

Create a stimulus from a spike train:

```
spike_train = np.arange(10.0, 101.0, 10.0)
stimulus = pynn.Population(1, pynn.SpikeSourceArray, {"spike_times": spike_train})
```

There is also a Poisson spike source:

```
poisson_params = {
    "start": 10.0,
    "duration": 100.0,
    "rate": 5.0
    }
stimulus = pynn.Population(1, pynn.SpikeSourcePoisson, poisson_params)
```

Synaptic connections

Connect all pre-synaptic to all post-synaptic neurons:

```
weight = 15 * pynn.minExcWeight()
conn = pynn.AllToAllConnector(weights=weight)
proj = pynn.Projection(pre, post, conn)
```

Specify connections in a list:

```
conn = pynn.FromListConnector([(7, 13, w, d), (42, 0, w, d)])
```

Other connectors (look at specification):

FixedNumberPreConnector

FixedNumberPostConnector

FixedProbabilitvConnector

Recording observables

Spike times:

```
neurons.record()
...
spikes = neurons.getSpikes()
```

Analog membrane traces:

```
pynn.record_v(neurons[0], "")
```

- only one analog-to-digital converter (ADC)
- → one can record a single neuron at a time

Tasks

Task 1: a single neuron

- create a spike source
- create a single LIF neuron
- connect these two populations with maximum weight
- record spikes and the membrane trace of the stimulated neuron

- 1. vary the synaptic weight and observe the membrane trace
- 2. play around with the inter-spike interval of the stimulating spike train
- 3. observe how the PSPs stack up and eventually cause the neuron to fire

Task 2: passing spikes

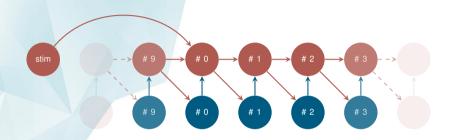

- extend the network by adding another neuron
- record and plot the spikes of both neurons

- think about different possibilities of creating and connecting the neurons
- check that the stimulation is passed to the second neuron

Task 3: a closed synfire chain

- create ten excitatory and ten inhibitory populations of neurons and connect them as depicted
- create a transient stimulus to the zeroth excitatory population
- record and plot the spikes of the neurons

record the membrane potential of a neuron of your choice

Task 3: a closed synfire chain

- 1. evaluate the stability of the chain by tweaking the weight parameters
- 2. what happens if you disconnect the inhibitory neurons?
- 3. modify the chain length

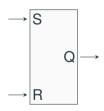

Task 4: a neural SR latch

Think about how to create a simple SR latch (set/reset latch).

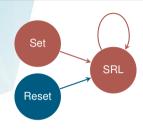

S	R	Q
0	0	no change
0	1	Q = 0, reset state
1	0	Q = 1, set state
1	1	undefined

Task 4: a neural SR latch

- · create a population of latch neurons and project them onto themselves
- create a transient excitatory and a transient inhibitory stimulus to the latch neurons
- set the stimuli such that the latch is switched on and off consecutively
- record and plot the spikes of the neurons
